

- I'm Josie, I've been working for Red Hat in consulting for 3 years in January
 - I focus on infrastructure, systems engineering type stuff
 - a lot of on-call and also a lot of more low-level stuff
 - currently setting up a lot of GPU clusters, configuring RDMA/RoCE – not InfiniBand yet
 - reputation for putting on-call on rare architectures such as mainframes or RISC
 - I've been doing open source stuff since I was a teenager and I'm still very involved in upstream projects.
 - I'm the lead maintainer for one of the Kubernetes cluster autoscaler implementations
 - I do things for Arch Linux mainly around packaging and early userspace stuff like initial RAMFS and maintain some other packages
 - I also ported Arch to s390 for fun
 - and I wrote some kernel patches for Linux on s390 architecture
 - before I joined Red Hat I worked for a fintech unicorn where I was heading up the SRE team
 - I've been doing more and more upstream work to accelerate customer outcomes and that made me realize that I enjoy the engineering part more than implementing the more off-the-rack solutions for our customers
